PBCore Export - Program Information Screen

From the **Program Information** Screen:
When using the Program Information screen to access the data - users have the option to export information about an *individual program* or the *entire series*
In this example – generic program query for NOVA
Searching for NOVA gives us 1374 program files
To export information to PBCore – navigate to Tools/PBCore Export; or use the keyboard shortcut of Alt+P

PBCore Export Alt+P
Change Channel Shift+!
This dialogue box will open

*Please note – ProTrack allows users to save the export as either PBCore Version 1 (v1) or Version (v2). For information about the difference between versions, visit www.PBCore.org

Files can be exported for an individual episode:
Export file looks like this and includes all the metadata available in ProTrack for this specific episode.
Or for the entire series:

- Please note - full series export will only trigger when starting on the first listed episode of the series
Files are saved to a local drive with a naming convention of NOLA_episode#_program type (HDBA, SDBA, HDUE43 etc.)

When exporting the entire series – ProTrack will create at zip file containing the metadata for every episode in the series (this may take a few minutes depending on the number of programs in the series)
